## **Amendments to the Claims:**

1. (Previously Presented) A magnetic resonance imaging method comprising:

dividing k space into a central region disposed at k space center and one or more annular surrounding regions having increasing distances from k space center, the one or more annular surrounding regions including an outermost surrounding region having a largest distance from k space center;

acquiring k space samples in the central region;

subsequent to the acquiring of k space samples in the central region, acquiring k space samples in the one or more annular surrounding regions, the k space samples in the outermost surrounding region being acquired last, the acquiring of k space samples in at least the outermost surrounding region using a row by row data acquisition ordering in which each row of k space samples acquired in the outermost surrounding region, together with selected already acquired k space data from the regions other than the outermost surrounding region, forms a completed data set for reconstructing an image plane; and

reconstructing each completed data set into a reconstructed image plane without waiting for all k space samples in the outermost surrounding region to be acquired such that the reconstructing occurs at least partially concurrently with the acquiring.

- 2. (Original) The method as set forth in claim 1, further comprising:
  displaying each reconstructed image plane once it is available without
  waiting for the reconstructing of other image planes.
- 3. (Previously Presented) The method as set forth in claim 1, further comprising:

synchronizing the acquiring of k space samples in the central region with a trigger signal, the trigger signal being one of: (i) a selected duration after administering a magnetic contrast agent bolus, (ii) detecting a change in a magnetic

resonance signal intensity due to wash in of a magnetic contrast agent bolus, (iii) detecting a gating signal, and (iv) detecting a selected physiological event.

4. (Previously Presented) The method as set forth in claim 1, further comprising:

selecting a plurality of magnetic resonance imaging parameters for the acquiring of k space samples in the central region and in the one or more annular surrounding regions, the plurality of magnetic resonance imaging parameters including at least a data acquisition rate; and

determining the central region using (i) the selected plurality of magnetic resonance imaging parameters and (ii) a time interval for the acquiring of k space samples in the central region.

- 5. (Previously Presented) The method as set forth in claim 1, wherein the central region has a round or oval perimeter, and the outermost surrounding region has a round or oval inner perimeter and a square or rectangular outer perimeter.
- 6. (Previously Presented) The method as set forth in claim 1, wherein the acquiring of k space samples in the central region uses an acquisition ordering other than a row by row acquisition ordering.
- 7. (Previously Presented) The method as set forth in claim 6, wherein the acquiring of k space samples in the central region uses a random or pseudorandom ordering.
- 8. (Previously Presented) The method as set forth in claim 7, further comprising:

synchronizing the acquiring of k space samples in the central region with the administering of a magnetic contrast agent bolus.

9. (Original) The method as set forth in claim 6, further comprising:

sorting the k space samples of the central region into a row by row ordering.

- 10. (Previously Presented) The method as set forth in claim 1, wherein the one or more annular surrounding regions include at least two surrounding regions, and the acquiring of k space samples in the one or more annular surrounding regions other than the outermost surrounding region uses a random or pseudorandom ordering.
- 11. (Previously Presented) The method as set forth in claim 1, wherein the one or more annular surrounding regions include at least two surrounding regions, and the acquiring of k space samples in every annular surrounding region including the outermost surrounding region uses a row by row acquisition ordering.
- 12. (Previously Presented) The method as set forth in claim 1, wherein each k space sample is a readout line of k space.
- 13. (Original) The method as set forth in claim 1, wherein the acquiring of k space samples in at least the outermost surrounding region using a row by row acquisition ordering includes:

acquiring the k space samples using a serpentine row by row acquisition ordering.

14. (Original) The method as set forth in claim 1, wherein the acquiring of k space samples in at least the outermost surrounding region using a row by row acquisition ordering includes:

applying secondary coordinate magnetic field gradients to traverse each row of k space samples; and

switching to each new row of k space samples by applying a primary coordinate magnetic field gradient, the primary coordinate being generally transverse to the secondary coordinate.

- 15. (Original) The method as set forth in claim 1, wherein the acquiring of k space samples in at least the outermost surrounding region using a row by row acquisition ordering includes:
- (i) acquiring a first row of k space samples by traversing secondary coordinate positions in a positive direction at a first primary coordinate position;
- (ii) applying a primary coordinate magnetic field gradient to move to a second primary coordinate position;
- (iii) acquiring the second row of k space samples by traversing secondary coordinate positions in a negative direction at the second primary coordinate position; and
- (iv) repeating (i), (ii), and (iii) to acquire a plurality of rows of k space samples indexed by the primary coordinate.
- 16. (Previously Presented) The method as set forth in claim 15, wherein the primary coordinate is a slice coordinate, the secondary coordinate is a phase encode coordinate orthogonal to the slice coordinate, and each k space sample is a readout line along a third coordinate orthogonal to both the slice and phase encode coordinates.
- 17. (Original) The method as set forth in claim 1, wherein the acquiring of k space samples in at least the outermost surrounding region using a row by row acquisition ordering includes:
- (i) acquiring a first contiguous portion k space samples along a row within the outermost annular surrounding region;
- (ii) skipping at least samples along the row contained in the central region;
- (iii) acquiring a second contiguous portion k space samples along the row within the outermost annular surrounding region, the second contiguous portion k space samples along the row being separated from the first contiguous portion k space samples along the row by at least the central region; and
  - repeating (i), (ii), and (iii) for each row of the row by row acquisition.

- 18. (Withdrawn) A magnetic resonance imaging apparatus comprising:
- a magnetic resonance imaging scanner imaging an associated imaging subject;
- a magnetic resonance imaging controller performing a method including:
- (i) dividing k space into a central region disposed at k space center and one or more annular surrounding regions having increasing distances from k space center and including an outermost surrounding region of largest distance from k space center,
- (ii) determining an optimum time for imaging a magnetic contrast agent bolus,
- (iii) acquiring k space samples in the central region at about the optimum time, and
- (iv) after acquiring the k space samples in the central region, acquiring k space samples in the one or more annular surrounding regions the acquiring in at least the outermost surrounding region using a plane by plane data acquisition ordering in which all k space samples in the outermost surrounding region belonging to a current k space plane are acquired to complete the current k space plane before samples in the outermost surrounding region belonging to other k space planes are acquired; and
- a reconstruction processor that reconstructs the completed current k space plane into a reconstructed plane image without waiting for other k space planes to be completed.
- 19. (Withdrawn) The magnetic resonance imaging apparatus as set forth in claim 18, wherein the acquiring of k space samples in the central region includes:

acquiring k space samples in the central region using an ordering other than a plane by plane ordering.

20. (Withdrawn) The magnetic resonance imaging apparatus as set forth in claim 18, wherein the acquiring of k space samples in the central region includes:

acquiring k space samples in the central region using a random or pseudorandom ordering.

21. (Withdrawn) The magnetic resonance imaging apparatus as set forth in claim 20, further comprising:

a display device that displays each reconstructed plane image once the reconstruction processor completes reconstruction of the corresponding k space plane, without waiting for the reconstruction processor to reconstruct other k space planes.

22. (Withdrawn) A magnetic resonance imaging apparatus comprising:

means for dividing k space into a central region disposed at k space center and one or more annular surrounding regions having increasing distances from k space center, the one or more annular surrounding regions including an outermost surrounding region having a largest distance from k space center;

means for acquiring k space samples in the k space, the k space samples in the central region being acquired first, the k space samples in the outermost surrounding region being acquired last, the k space samples in at least the outermost surrounding region being acquired using a row by row data acquisition ordering in which each row of k space samples acquired in the outermost surrounding region completes a k space plane; and

means for reconstructing each completed k space plane into a reconstructed image plane without waiting for all k space samples in the outermost surrounding region to be acquired.

23. (Withdrawn) The apparatus as set forth in claim 22, wherein the acquiring means includes:

- (i) means for acquiring a row of k space samples by traversing secondary coordinate (cs) positions in a positive direction at a first primary coordinate position (cp);
- (ii) means for applying a primary coordinate (cp) magnetic field gradient to move to a second primary coordinate (cp) position;
- (iii) means for acquiring the second row of k space samples by traversing secondary coordinate (cs) positions in a negative direction at the second primary coordinate (cp) position; and
- (iv) means for repeatedly invoking the means (i), (ii), and (iii) to acquire a plurality of rows of k space samples indexed by the primary coordinate (cp).
- 24. (Withdrawn) The apparatus as set forth in claim 22, wherein the acquiring means acquires at least the central region using other than a row by row acquisition ordering, and the reconstructing means includes:

means for sorting k space samples acquired in other than a row by row acquisition ordering into a row by row ordering.

25. (Withdrawn) The apparatus as set forth in claim 22, wherein the reconstructing means includes:

means for organizing k space samples of the completed k space plane from the central region and from the one or more annular surrounding regions into a k space plane data set organized row by row;

means for Fourier transforming each k space sample of the completed k space plane in a first direction to recover spatial content in the first direction; and

means for Fourier transforming the k space plane data set organized row by row in a second direction transverse to the first direction to recover spatial content in the second direction.

26. (Previously Presented) A magnetic resonance imaging apparatus including one or more processors programmed to perform the method of claim 1.

- 27. (Previously Presented) A computer medium carrying a computer program for controlling one or more processors to perform the method of claim 1.
- 28. (Previously Presented) A magnetic resonance imaging apparatus including means for performing the steps of claim 1.
